

Lesson Learned: ROP Limiting at Fast Drilling Breaks (illustrative)

Document ID: LL-MN-DW-03-ECD-MANAGEMENT | Type: LESSON | Well: MN-DW-03 | Date: 2025-02-28

Context & Finding

Fast penetration in clean sands ($> 25 \text{ m/hr}$) generates dense annular cuttings packs that surge ECD beyond the shoe FIT. In narrow margin drilling, driller must proactively limit ROP to 12 m/hr regardless of drillability.
